

Fjord Line Ships Use FlowMark to Condition Potable Water

January 2013

Fjord Line of Denmark has purchased two FlowMark Web Induction Pulsed Power systems to protect the potable water plumbing systems of two new ships.

The Web Induction systems are installed on the discharge piping of the bulk water tanks in order to prevent calcium scale from forming throughout the ships extensive plumbing system.

Success was immediately apparent when the ships engineers realized that FlowMark was preventing scale from forming on the quartz tubes of the ships Ultraviolet Disinfection System.

FlowMark is protecting hot water boilers, kitchen equipment, cabin fixtures, disinfection systems and all piping from hard water scale.

Two FlowMark model Mark-III systems installed on two new Fjord Line Ships
